1. INTRODUCTION

1.1 ProjectOverview

In this project, we mainly focus on the analysis of the Vehicle Resale Predict and then predict the results through them using training data. The trade in the vehicle market is an always rising industry, which has nearly multiplied it's fairly estimated worth over the most recent couple of years. The rise of online entrances like CarDekho, Quikr, Carwale, Cars24, and numerous others has worked with the requirement for both the client and the merchant to be better educated about the patterns and examples that decide the worth of the pre-owned vehicle on the lookout. AI calculations can be utilized to anticipate the retail worth of a vehicle, in light of a specific arrangement of highlights. Various sites have various calculations to create the retail cost of the trade-in vehicles, and subsequently there is certainly not a brought together calculation for deciding the cost. Via preparing measurable models at foreseeing the costs, one can undoubtedly get a good guess of the cost without really entering the subtleties into the ideal site. The fundamental target of this paper is to utilize three distinct expectation models to anticipate the retail cost of an utilized vehicle and think about their degrees of precision. The informational collection utilized for the forecast models was made by Shonda Kuiper. The information was gathered from the 2005 Focal Edition of the Kelly Blue Book and has 804 records of 2005 GM vehicles, whose retail costs have been determined. The informational index fundamentally contains unmitigated qualities alongside two quantitative characteristics and then test data of academics not only external exams, but also the overall academic performance of each and every student. In a significant number of the universities, when we see the scholastic execution examination is done, however there is no framework that predicts the understudy's exhibition ahead of time. Of which if understudy fizzles in an Exam. Here we consider both inward and outside imprints for examining scholastic execution of an understudy in the school which is investigated utilizing SVM calculation and afterward Linear Regression calculation.These predictions are done using the previous results of the Previous Data Set.

1.2 Purpose

With difficult economic conditions, it is likely that sales of second-hand imported cars and used carswill increase. In many developed countries, it is common to lease a car rather than buying it outright. After the lease period is over, the buyer has the possibility to buy the car at its residual value, i.e. its expected resale value. Thus, it is of commercial interest to sellers/financers to be able to predict the salvage value of cars with accuracy.

In order to predict the resale value of the car, we proposed an intelligent, flexible, and effective system

that is based on using regression algorithms. Considering the main factors which would affect the resale value of a vehicle a regression model is to be built that would give the nearest resale value of the vehicle. We will be using various regression algorithms and algorithms with the best accuracy will be taken as a solution, then it will be integrated to the web-based application where the user is notified with the status of his product.

2. Literature Survey

2.1 Existing Problem

As indicated by author Sameer Chand, they have done the forecasts of vehicle cost from the chronicled information that has been gathered from everyday papers. They have utilized the administered AI strategies for foreseeing the cost of vehicles. Numerous different calculations like various straight relapse, k-closest neighbor calculations, gullible based, and some choice tree calculations additionally have been utilized. Every one of the four calculations are looked at and tracked down the best calculation for forecast. They have confronted a few challenges in looking at the calculations, by one way or another they have overseen. As indicated by creators Pattabiraman, this paper is more focused on the connection among vender and purchaser. To foresee the cost of four wheelers, more highlights are required like previously given value, mileage, make, model, trim, type, chamber, liter, entryways, voyage, sound, cowhide. Utilizing these highlights the cost of the vehicle has been anticipated with the assistance of a factual investigation framework for exploratory information examination. As per creators in this paper they chiefly focus on gathering different information from web entryway by utilizing web scrap methods. Furthermore, those have been contrasted with the assistance of various AI calculations to foresee the vehicle cost in a simple way. They arranged the value as per various scopes of value that is as of now given. Fake neural organization, support vector machine, arbitrary timberland calculations were utilized on various datasets to construct classifiers models. Another methodology was given by Richardson in his postulation work. In his hypothesis it states more strong vehicles will be delivered by vehicle makers. He looked at the crossover vehicles and conventional vehicles in scrapers. It really holds their incentive for longer time utilizing numerous relapse procedures. This works on the natural conditions, and furthermore it assists with giving colossal effectiveness of utilizing energizes. Wu et al, in this paper they have utilized neuro fluffy information based framework to exhibit vehicle value forecast. By considering the accompanying ascribes like brand, year of creation and sort of motor they anticipated a model which has comparative outcomes as the basic relapse model. Additionally, they made a specialist framework named ODAV (Optimal Distribution of Auction Vehicles) as there is a popularity for selling the by vehicles toward the finish of the renting year by vehicle vendors. This framework gives experiences into the best costs for vehicles, just as the area where all that cost can be acquired. To anticipate a cost of vehicles, the K – closest neighbor AI calculation has been utilized which depends on relapse models. More vehicles have been traded through this framework so this specific framework is all the more effectively oversaw.

LITERATURE REVIEWS

1. CAR RESALE VALUE PREDICTION USING MACHINE LEARNING BY

- **Prashant Gajera**
- **Akshay Gondaliya**
- **Jenish Kavathiya**

The world is growing day by day and the expectations of every person are also growing up. Out of all the expectations one of them is to buy a car. But all are not able to buy a new car, so they will buy a used one. But new people don't know about the market price for his or her dream car for old car. That is where we need a platform which helps new people for car price prediction. In this paper we are coming up with that platform which is made using machine learning technology. Using supervised machine learning algorithms such as linear-regression, KNN, Random Forest, XG boost and Decision tree, let's try to build a statistical model which will be able to predict the price of a used car. For that, previous consumer data and a given set of features will help us. And we will also be comparing the prediction accuracy of these models to determine the optimal one.

Concluding whether a used car is worth the posted price when you see listings online can be difficult. Several factors, including mileage, make, model, year, km driven etc. can affect the actual worth of a car. From the perspective of a seller, it is also a difficulty to price a used car appropriately. Based on existing data, the aim is to use machine learning algorithms to develop models for predicting used car prices.

1.LINEARREGRESSIONFORCARSALESPREDICTIONININDIANAUTOMOBILEINDUSTRYBY

- **RohanKulkarni**
- **AnujaBokhare**

SUPPORTVECTORREGRESSIONANALYSISFORPRICEPREDICTIONBYMarianaListiani

To remain profitable under a tight competition, a leasing company has to offer a good leasing price. In order to determine the right price, it is necessary to predict the future price of a second hand car.

By knowing the car's value depreciation, the leasing price could be set to cover it. The approach commonly used for a price prediction task is multiple linear regression analysis. However, there are a large number of factors that drive the price, that make this crucial task di-cult. The standard regression approach might not be suitable for high dimensional data. A modern data mining technique which is independent of input dimension, namely Support Vector Regression, will be applied to overcome this potential problem. The forecasting

accuracy will then be compared against the statistical regression model. In particular, a fully automatic approach for tuning and applying SVR is developed, borrowing ideas from the field of evolutionary search. The whole experiment with the machine learning approach is based upon real-world data from a leading German car manufacturer.

DETERMINANTSOFUSEDCARRESALEVALUEBYMichaelS.Richardson

Hybrid vehicles have recently emerged as a growing market segment in the automobile industry. The value these vehicles hold over time has important implications for consumers. Vehicles that maintain their value better over time are likely to be in higher demand, and thus auto-makers are keen on producing more and more of these vehicles in the next few years. Using a multiple variable regression analysis, this thesis analyzes the major determinants of resale value in used cars. Current market values of used cars compared with their original prices are used as data. This study predicts that hybrid vehicles maintain their value better than traditional vehicles due to environmental perceptions as well as fuel efficiency ratings.

CARVALUEPREDICTIONUSINGMACHINELEARNINGBYYash,M.M.G.Y.D

A fair car value prediction has made it so easy for the buyers to get a car home, as it just requires a few efforts and brains of field experts. Day to day, there are many brands that bring new models to the market with lavish prices. Customers not being capable of buying a new car financially due to the higher market price, there is a need for used car value prediction globally which effectively determines the worthiness of a car that can be bought without much thinking. To train a model for predicting the price of used cars we applied machine learning techniques i.e., Regression Algorithms because it provides us continuous value as an output and not a categorized value such as Random Forest, linear regression and other algorithms for getting better accuracy. Then after processing the data from the dataset collected from Kaggle, we will be comparing the performance of different algorithms to get a chosen output.

Further it would be available in GUI as a Web-application developed using Python-flask making it user friendly so that users could give input and get the price of a car according to it.

Problemstatement

Machine learning has become a tool used in almost every task that requires estimation. Companies like cars24 and cardekho. Com uses Regression analysis to estimate the used car prices. So we need to build a model to estimate the price of cars. The model should take car-related parameters and output a selling price. The selling price of a used car

depends on certain features as mentioned below

- Fuel Type
- Manufacturing year
- Miles Driven
- Number of Historical Owners
- Maintenance Record

This is a supervised learning problem and can be solved using regression techniques. We need to predict the selling price of a car based on the given car's features. Supervised Regression problems require labeled data where our target or dependent variable is the selling price of a car. All other features are independent variables.

Following are some regression algorithms that can be used for predicting the selling price.

- Linear Regression
- Decision Tree Regressor
- Support Vector Regressor
- KNN Regressor
- Random Forest Regressor

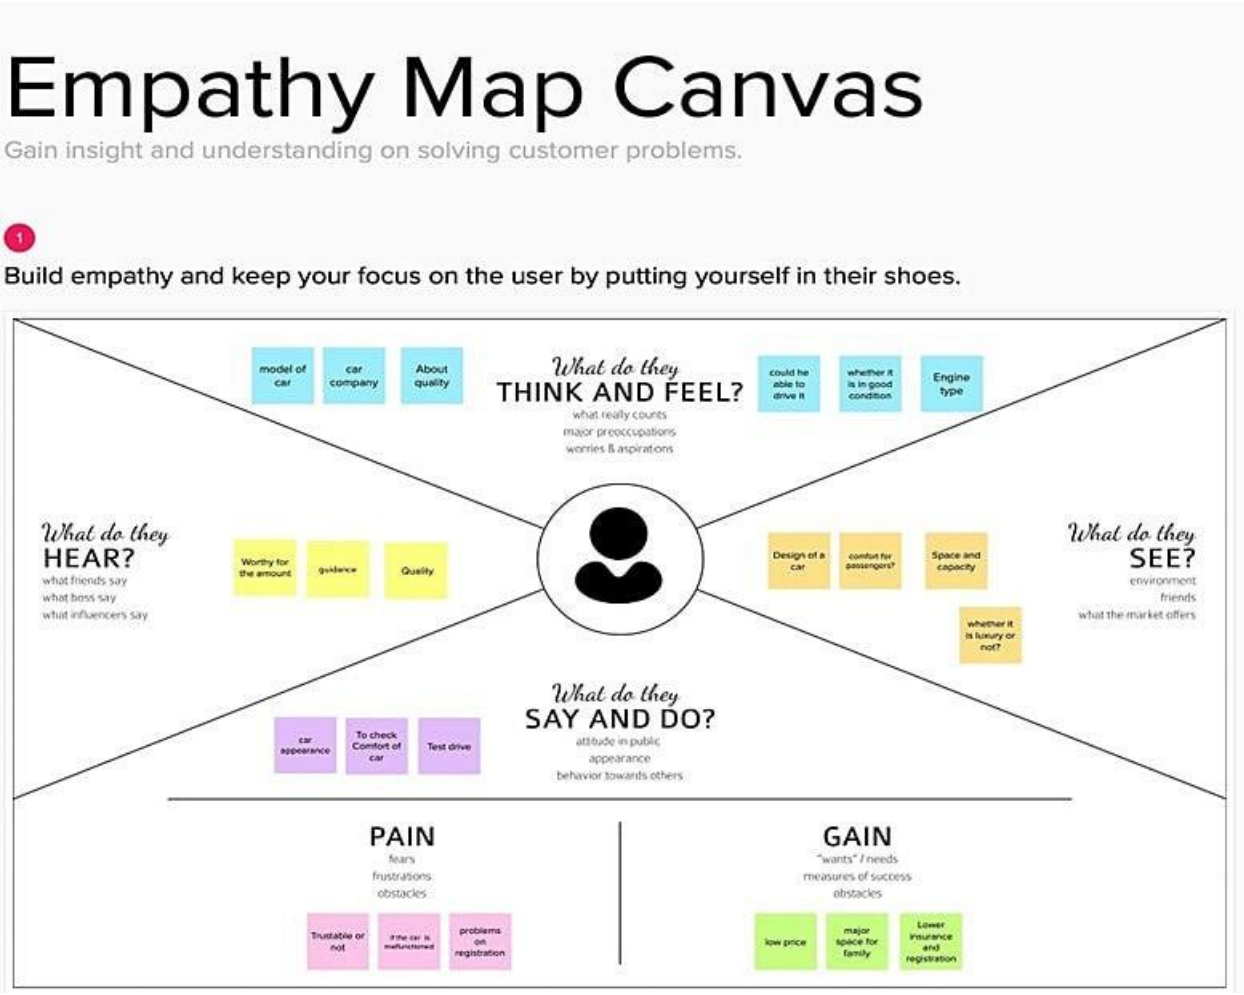
Linear Models are relatively less complex and explainable, but linear models perform poorly on data containing the outliers. Linear models fail to perform well on non-linear datasets. In such cases, non- linear regression algorithms Random Forest Regressor and XGBoost Regressor perform better in fitting the nonlinear data.

We will use Random Forest Regressor for predicting the selling price of cars. Our data contains some outliers, and treating them is entirely possible, but the performance of nonlinear regression models is insensitive to outliers.

3.IDEATION AND PROPOSED SOLUTION

3.1 Empathy Map Canvas:

Empathy Map:- An empathy map is a collaborative visualization used to articulate what we know about a particular type of user.



3.2 Ideation and Brainstorming

Template

Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

10 minutes to prepare
1 hour to collaborate
2-8 people recommended

Share template feedback

Before you collaborate

A little bit of preparation goes a long way with this session. Here's what you need to do to get going.

10 minutes

A **Team gathering**
Define who should participate in the session and send an invite. Share relevant information or pre-work ahead.

B **Set the goal**
Think about the problem you'll be focusing on solving in the brainstorming session.

C **Learn how to use the facilitation tools**
Use the Facilitation Superpowers to run a happy and productive session.

Open article →

1 Define your problem statement

What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

5 minutes

PROBLEM
How might we [your problem statement]?

Key rules of brainstorming

To run an smooth and productive session

- Stay in topic.
- Encourage wild ideas.
- Defer judgment.
- Listen to others.
- Go for volume.
- If possible, be visual.

Need some inspiration?

See a finished version of this template to kickstart your work.

Open example →

2 Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

TIP

You can select a sticky note and hit the pencil [switch to sketch] icon to start drawing!

NITHIN REDDY

SAHITH ANDEY

GOWTHAM REDDY

PAVAN VARMA

ROHIT VARMA

3 Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you and break it up into smaller sub-groups.

20 minutes

TIP

Add customizable tags to sticky notes to make it easier to find, browse, organize, and categorize important ideas as themes within your mural.

Project Design Phase-I Proposed

Solution Template

3.4 Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S. No	Parameter	Description
1.	Problem Statement (Problem to be solved)	Machine learning has become a tool used in almost every task that requires estimation. Companies like cars24 and cardekho.com use Regression analysis to estimate the used car prices. So we need to build a model to estimate the price of cars. The model should take car- related parameters and output a selling price. The selling price of a used car depends on certain features as mentioned below 1. Fuel Type 2. Manufacturing year 3. Kilometers Driven 4. Number of Previous Owners 5. Maintenance Record
2.	Idea / Solution description	This project aims to deliver price prediction models to the public, to help and guide the individuals looking to buy or sell cars and to give them a better insight into the automotive sector. Buying a used car from a dealer can be a frustrating and an unsatisfying experience as some dealers are known to deploy deceitful to close a deal. Therefore, to help consumers avoid falling victims to match tactics, this study hopes to equip consumers with the right tools to guide them in their shopping experience. Another goal of the project is to

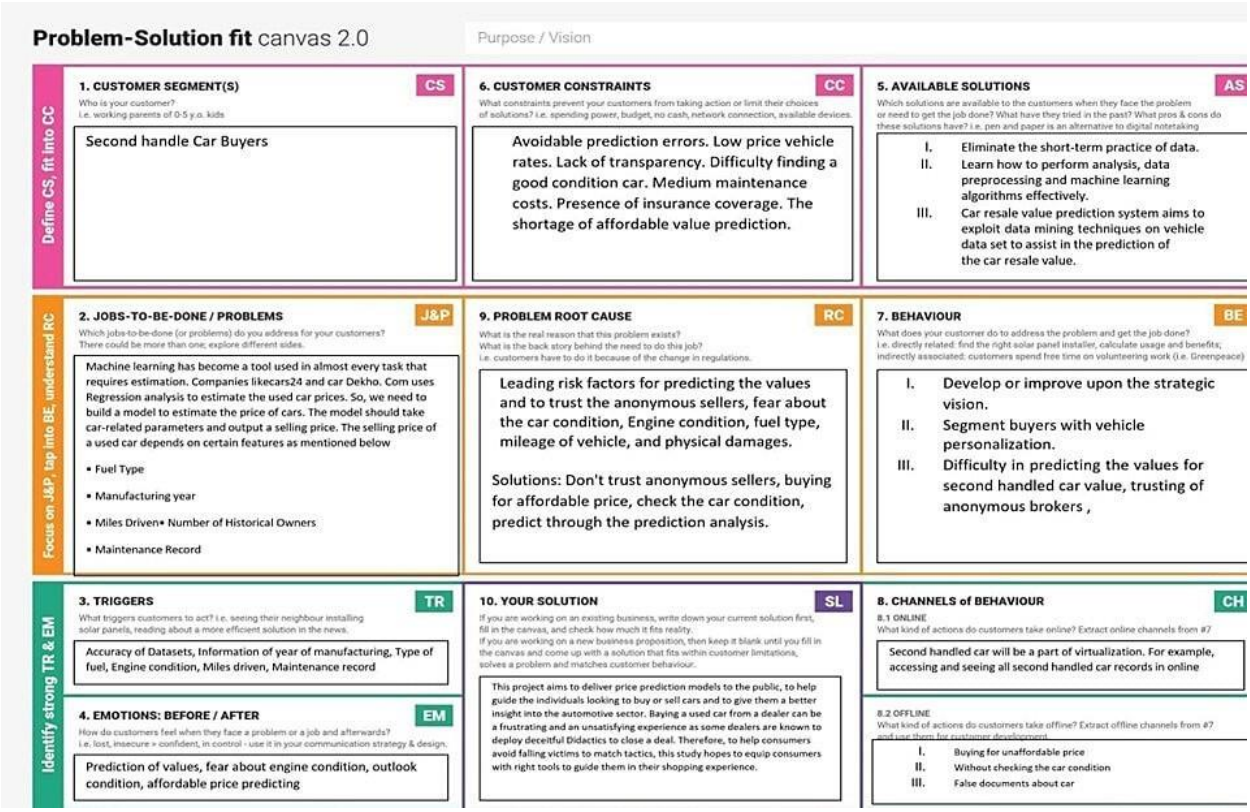
		explore new methods to evaluate used cars prices and to compare their accuracies.

3.	Novelty / Uniqueness	As there are so many ongoing experiments that use statistical approaches and some traditional methods to focus on predicting item sales. Most researchers have experimented by taking a single algorithm to predict sales. In this thesis Machine Learning algorithms such as Simple Linear Regression, Support Vector Regression, Gradient Boosting algorithm, and Random Forest Regression are considered for predict the most effective metrics such as accuracy, mean absolute error, and max error are considered for measuring algorithm efficiency. This method will be very beneficial in the future for advanced item sales forecasting,

4.	Social Impact / Customer Satisfaction	In the study, the variables having significant effects on the price of the second hand car were determined. A prediction model was established with these variables. The coefficient of determination (R2) of this model was calculated as 89.1%. The variables included in the estimation model are Brand, Model, Model Year, Fuel Type, Horse Power, Kilometers, Manual Air Conditioning, Fog Lights, Seat Air Cushion, Leather Steering Wheel, Wheel Rim, Automatic Air Conditioning, Start Stop, Rain Sensor, Sunroof, Electric Folding Mirrors, Xenon Headlight, Knee Airbag, Upholstery Leather, Memory Seat, 4X4, Parking Assistant, Vacuum Door.
5.	Business Model (Revenue Model)	Deciding whether a used car is worth the posted price when you see listings online can be difficult. Several factors, including mileage, make, model, year, etc. can influence the actual worth of a car. From the perspective of a seller, it is also a dilemma to price a used car. Based on existing data, the aim is to use machine learning algorithms to develop models for predicting used car prices.

6.	Scalability of the Solution	We started with understanding the use case of machine learning in the Automotive industry and how machine learning has transformed the driving experience. Moving on, we looked at the various factors that affect the resale value of a used car and performed exploratory data analysis (EDA). Further, we build a Random Forest Regression model to predict the resale value of a used car. We could have also used simpler regression algorithms like Linear Regression and Lasso Regression. Still, we need to make sure there are no outliers in the dataset before implementing them. Pair plots and scatter plots help visualize the outliers

3.3 Proposed Solution Fit



4.REQUIREMENT ANALYSIS

4.1 Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration to the related websites	Registration through Form Registration through Gmail Registration through LinkedIN
FR-2	User Confirmation	Confirmation via Email Confirmation via OTP
FR-3	Users Profile	Personal details, Bank account ,Is He/She interested in buying a car
FR-4	Gather information about the vehicle	Through the registered websites they collect information
FR-5	Display the functionality of the vehicle	Details: Fuel type , Manufactured year , Miles Driven , Record

4.2 Non-functional Requirements:

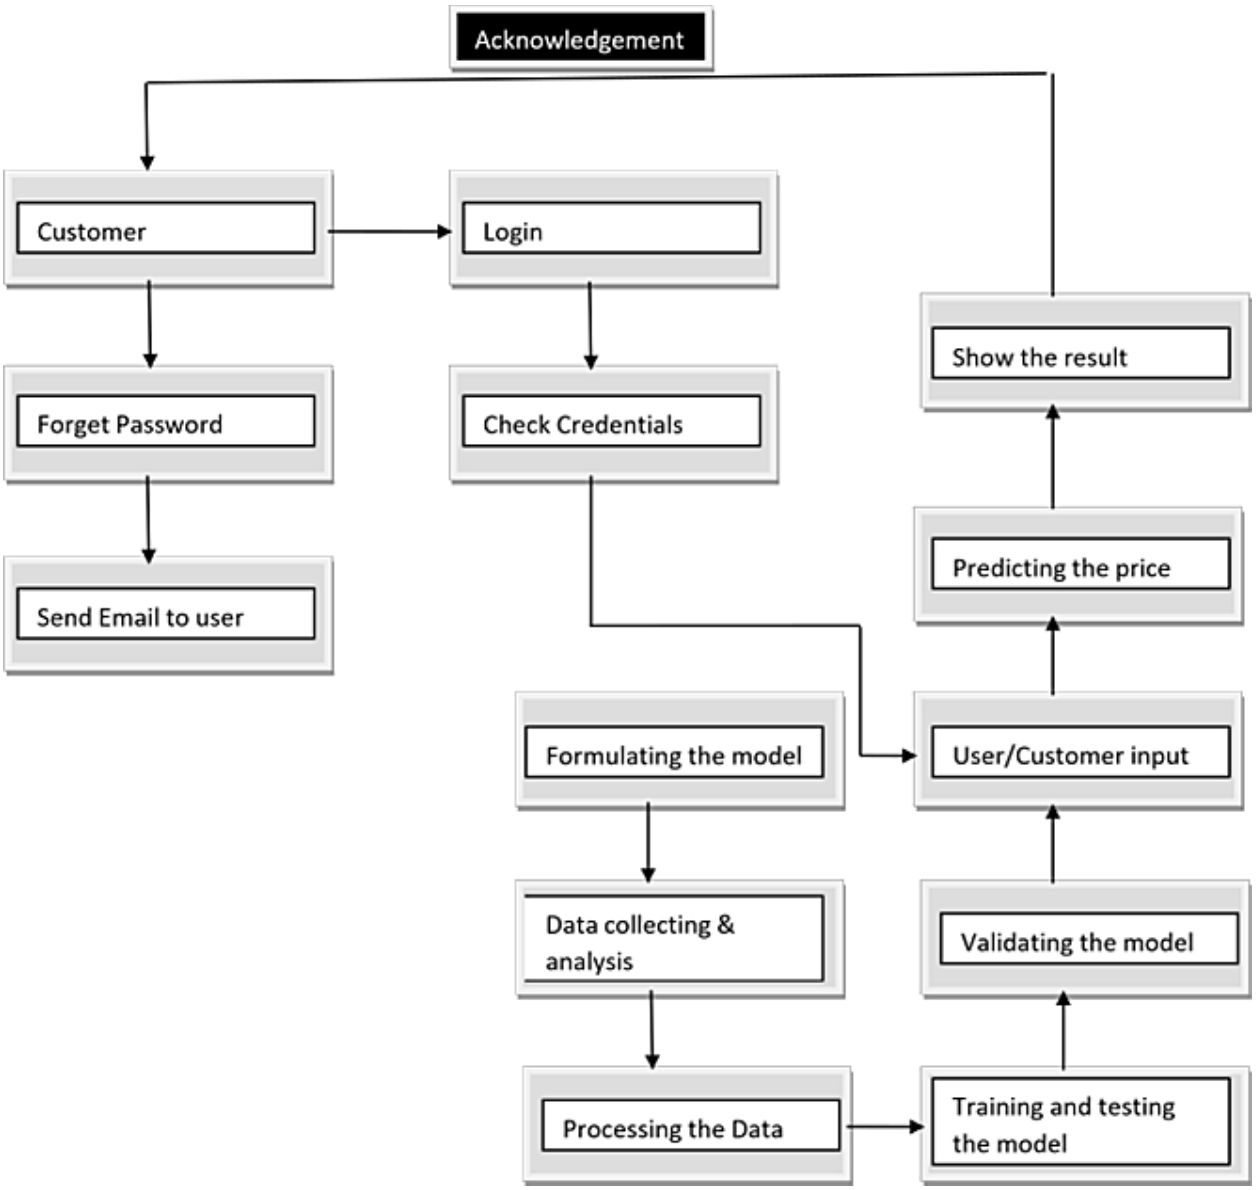
Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	**Usability**	User friendly UI Simple and easy to Understand
NFR-2	**Security**	Aware of scams

NFR-3	**Reliability**	The system must perform without failure
NFR-4	**Performance**	The landing page must support several users must provide 5 second or less response time
NFR-5	**Availability**	Uninterrupted services must be available all time except the time of server updation.
NFR-6	**Scalability**	that can handle any amount of data and perform many computations in a cost-effective and time-saving way to instantly serve millions of users residing at global locations.

5. PROJECT DESIGN

5.1 Data Flow Diagram:



5.2 TECHNICAL ARCHITECTURE:

The Deliverable shall include the architectural diagram as below and the information as per the

Table-1 : Components & Technologies:

S.No	Component	Technology
1.	User Interface	HTML, CSS, JavaScript
2.	Application Logic-1	Python
3.	Application Logic-2	IBM Watson
4.	Machine Learning Model	Random forest

Table-2: Application Characteristics:

S.No	Characteristics	Technology
1.	Open-Source Frameworks	Flask
2.	Performance	It can handle about 100 requests per second

6. PROJECT PLANNING AND SCHEDULING

6.1 Sprint Planning and Estimation:

Sprint-2

Test case ID	Feature Type	Component	Test Scenario	Steps To Execute	Test Data	Expected Result	Actual Result	Status	Executed By
Register_Page_01	UI	Landing Page	The Landing page must be responsive and the user must be redirected to register page once get started is clicked	1) Enter the URL and go 2) Click get started	[illegible]	The page should load and once the user clicks get started the user must be navigated to register page	Worked as expected	Pass	Akash
Register_Page_02	UI	Register Page	The Register page must allow the user to register to the website	1) Enter the URL and go 2) Click get started 3) Fill your credentials 4) Click register	[illegible]	The page should render three text boxes to fill name, email and password and the user should also be able to click register	Worked as expected	Pass	Danushraj
Register_Page_03	Functional	Register Page	The Register page should register the user to backend service	1) Enter the URL and go 2) Navigate to register page 3) Fill credentials and click register	[illegible]	The page should add a user to backend authentication service	Worked as expected	Pass	Charanraj

	Test scenarios
1	Verify if the user is able to see the landing page
2	Verify if the user is able to navigate to register page
3	Verify if the user is able to click all the buttons in the application
4	Verify if the user is able to register to backend authentication service

Sprint-3

Test case ID	Feature Type	Component	Test Scenario	Steps To Execute	Test Data	Expected Result	Actual Result	Status	Executed By
Login_Page_01	UI	Login Page	The login page must load properly and be responsive	1) Visit the URL and go 2) Click get started button in the landing page 3) Navigate to the login tab	[illegible]	The user should be able to visit the login table in the registration page	Worked as expected	Pass	Cibikumar
Login_Page_02	Functional	Login Page	Verify the user to login and continue to the application dashboard page when the user logs in first time	1) Visit the URL and go 2) Register by providing credentials 3) Navigate to login page 4) Fill credentials and login	[illegible]	The user should receive a mail asking to confirm their registration and then should be able to login to the application dashboard	Worked as expected	Pass	Akash
Login_Page_03	UI	Dashboard Page	The dashboard page must load and provide options for making a new prediction, logging out and display cards of previous predictions	1) Visit the URL and go 2) Login using credentials 3) View your previous predictions	[illegible]	The user should be navigated to the dashboard page and must be able to see buttons for viewing previous predictions, logging out and making new predictions	Worked as expected	Pass	Danushraj

	Test Scenarios
1	Verify if the user is able to view the login page
2	Verify if th user recieves email for verfication during first time login
3	Verify if ther user is navigated to the dashboard page
4	Verify if the user sees buttons for making new predictions, logging out and cards for previous predictions

Sprint-4

Test case ID	Feature Type	Component	Test Scenario	Steps To Execute	Test Data	Expected Result	Actual Result	Status	Executed By
Prediction_Form_01	UI	Prediction Form	The form should accept different inputs from the user	1) Visit the URL and go 2) Login using credentials 3) Make new predictions by clicking the button	[illegible]	The form must be accepting inputs from the user	Worked as expected	Pass	Charanraj
Prediction_Form_02	Functionality	Prediction Form	From the form inputs the app should retreive, predict the values and display it to the user	1) Visit the URL and go 2) Login using credentials 3) Make new predictions by clicking the button 4) Input data regarding the car and click predict	[illegible]	After submitting the app should display the predicted result	Worked as expected	Pass	Cibikumar
Prediction_Form_03	Functionality	Dashboard Page	The previous predictions must be displayed to the user	1) Visit the URL and go 2) Login using credentials 3) Make new predictions by clicking the button 4) Input data regarding the car and click predict 5) Click view all predictions	[illegible]	The user must be able to see their previous predictions	Worked as expected	Pass	Akash

	Test Scenarios
1	Verify if the user is able to input data to the prediction form
2	Verify if the user is able to view the output of the prediction
3	Verify if the user is able to view their previous predictions

Defect Analysis

This report shows the number of resolved or closed bugs at each severity level,and how they were resolved

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
By Design	2	3	1	1	7
Duplicate	1	0	3	0	4
External	2	0	0	1	3
Fixed	2	2	1	2	7
Not Reproduced	0	0	1	0	1
Skipped	0	0	1	1	2
Won't Fix	0	2	2	1	5
Totals	7	7	9	6	29

Test Case Analysis

This report shows the number of test cases that have passed, failed, and untested

Section	Total Cases	Not Tested	Fail	Pass
Home Page	5	0	0	5
Data Entry Page	15	0	0	15
Output Page	4	0	0	4
Hyper Parameter Tuning	3	0	0	3
Final Model Building	2	0	0	2
Flask Application	10	0	0	10
Train Model on IBM	3	0	0	3
Final Report Output	4	0	0	4

10. ADVANTAGES AND DISADVANTAGES

Advantages:

1. **Reasonable Price** - One can get Used Cars at lower price.
2. **Lower Depreciation Value** - Used Cars have lower Depreciation.
3. **Low Insurance** - Insurance Premium for used cars are often low.

Disadvantages:

1. **Less Reliable** - Used cars are less reliable.
2. **Frequent repairs** - One have to spend lots of time on repairs.
3. **Sounds in Engine** - Used cars may make strange sounds due to defects in engine and other car parts.

CONCLUSION :

Car price prediction can be a challenging task due to the high number of attributes that should be considered for the accurate prediction. The major step in the prediction process is collection and preprocessing of the data.

Data cleaning is one of the processes that increases prediction performance, yet insufficient for the cases of complex data sets as the one in this research. Applying single machine algorithm on the data set accuracy was less than 50%. Therefore, the

ensemble of multiple machine learning algorithms has been proposed and this combination of ML methods gains accuracy of 92.38%. This is significant improvement compared to single machine learning method approach. However, the drawback of the proposed system is that it consumes much more computational resources than single machine learning algorithm.

Although, this system has achieved approximate prediction of the car resale value , our aim for the future research is to test this system to work successfully with various data sets and accuracy. We will extend our test data with used cars data sets and validate the proposed approach.

FUTURE SCOPE :

Efficient use of deep learning such as LSTM (Long short-term memory) or RNN (Recurrent Neural networks) can be implemented once enough data is collected. This can improve accuracy and decrease Root Mean Square Error(RMSE) drastically.

Currently, system can only deal with approximate car price prediction. This can be extended to predict exact value of car in future enhancements.

One can also implement Convolutional Neural Network(CNN) to determine physical condition of the car from images like identifying dents, scratches etc. and thus

predicting more relevant resale value of a car.
